

Your track,Our Detour

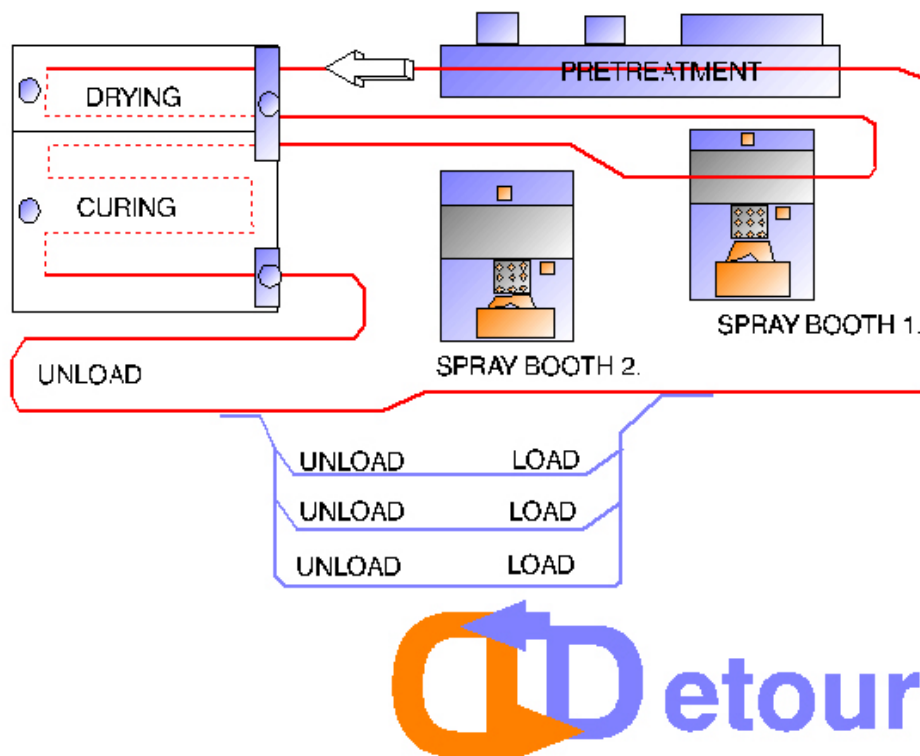

This unique system allows your track-carriers, or jigs, to automatically re-route onto the **Detour** track. The carrier may be unloaded, loaded, added to, stored or simply pass through another booth before being automatically reloaded back onto your main track.

Your existing track is not altered, the system relies on a **Detour adaptor** fixed to each jig or carrier, load and unload mechanisms are positioned around your own track.

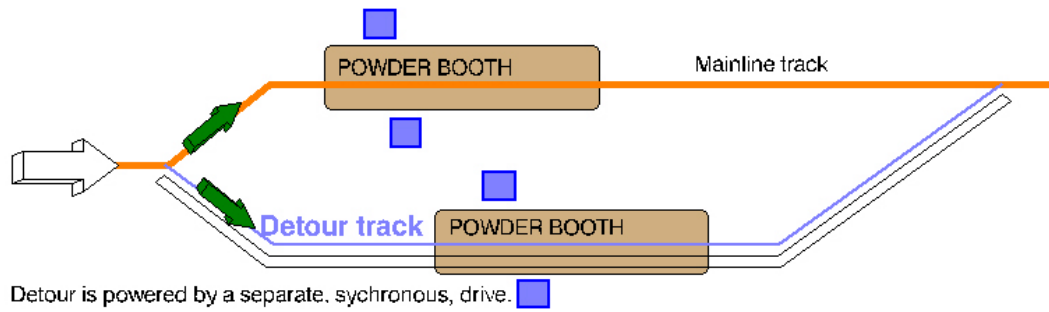

Carriers without **Detour** adaptors follow the normal path.

Your new **Detour** track may be designed for any configuration, be free running or powered. It may be as complex or as simple as you need..

- Add load and unload bays to your main line too ensure jigs are densely loaded for efficient processing. *No more chasing the track!*
- Allows heavy loads and carriers to be pre-loaded and moved onto the main line without lifting.

- Speed up colour changes. Have an alternative route while colour changes take place.

- Reroute empty jigs to burn off department. Reintroduce clean jigs fully loaded.
- Link two separate process lines.
- Process long items easily.
